Adjunctions for Pre-orders

Definition

Let $(P, \preceq_P)$ and $(Q, \preceq_Q)$ be two pre-ordered sets and let f and g be two homomorphisms (monotone maps) forth and back.

The maps f and g are **adjoint**, denoted $f \dashv g$, when for all $x \in P$, $y \in Q$,

$$f x \preceq_Q y \quad \text{iff} \quad x \preceq_P g y.$$

The map f is the **left adjoint** and the map g is the **right adjoint** (Awodey and Bauer 2022).

Universal Arrows

Definition

Let $G : \mathcal{D} \rightarrow \mathcal{C}$ be a functor and let C be an object of $\mathcal{C}$. A **universal arrow** from C to G is a pair (D, η) where D is an object of $\mathcal{D}$ and η is an arrow

$$\eta : C \rightarrow G_0 D$$

Introduction

We shall introduce abstract characterisations of the following facts of set theory:

- (i) The functions of a **set** X to a **set** Y , denoted Y^X , are also a **set**.
- (ii) A function of **two** variables $f : X \times Y \rightarrow Z$ can be represented as a function of **one** variable $\lambda f : X \rightarrow Z^Y$.

Exponentials

Set theory

Let Z^Y be the set of functions from the set Y to the set Z . For any set X and function $g : X \times Y \rightarrow Z$, the following diagrams commutes:

$$\begin{array}{ccc} & Z^Y & \\ \Lambda g \uparrow & & \\ X & & \end{array} \quad \begin{array}{ccc} & Z^Y \times Y & \xrightarrow{\text{eval}_{Y,Z}} Z \\ \Lambda g \times \text{id}_Y \uparrow & & \nearrow g \\ X \times Y & & \end{array}$$

$$(g = \text{eval}_{Y,Z} \circ (\Lambda g \times \text{id}_Y))$$

where

$$\text{eval}_{Y,Z} : (Z^Y \times Y) \rightarrow Z := (f, y) \mapsto f y$$

(application),

$$\Lambda g : X \rightarrow (Y \rightarrow Z) := x y \mapsto g(x, y)$$

(currying).

Exponentials

Definition

Let $\mathcal{C}$ be a category with binary products, and let Z and Y be objects of $\mathcal{C}$. The pair (Z^Y, eval) , where Z^Y is an object of $\mathcal{C}$ and eval is an arrow

$$\text{eval} : (Z^Y \times Y) \rightarrow Z$$

is an **exponential object** iff for any object X and arrow $g : X \times Y \rightarrow Z$, there is a **unique** arrow $\Lambda g : X \rightarrow Z^Y$ such that the following diagram commutes:

$$(g = \text{eval}_{Y,Z} \circ (\Lambda g \times \text{id}_Y))$$

Cartesian Closed Categories

Definition

A category is a **Cartesian closed category** iff it has finite products (i.e. a terminal object and binary products) and exponentials.
